L'angiographie coronaire fonctionnelle: Le nouveau gold standard de l'évaluation coronaire?

Eric Van Belle,

**Lille University Hospital
Heart & Lung Institute**

Functional testing and intravascular imaging for lesion assessment

Recommendations	Class	Level
When evidence of ischaemia is not available, FFR or iwFR are recommended to assess the haemodynamic relevance of intermediate-grade stenosis.	I	A

Patients with angina and/or dyspnoea and suspected coronary artery disease

Diagnostic approach (2)

^d Ability to exercise, individual test-related risks, and likelihood of obtaining diagnostic test result. ^e High clinical likelihood and symptoms inadequately responding to medical treatment, high event risk based on clinical evaluation (such as ST-segment depression, combined with symptoms at a low workload or systolic dysfunction indicating CAD), or uncertain diagnosis on non-invasive testing. ^f Functional imaging for myocardial ischaemia if coronary CTA has shown CAD of uncertain grade or is non-diagnostic. ^g Consider also angina without obstructive disease in the epicardial coronary arteries (see section 6 of full text).

Van Belle et al.

Routine Invasive Physiology in MVD

Gold Standard : FFR invasive

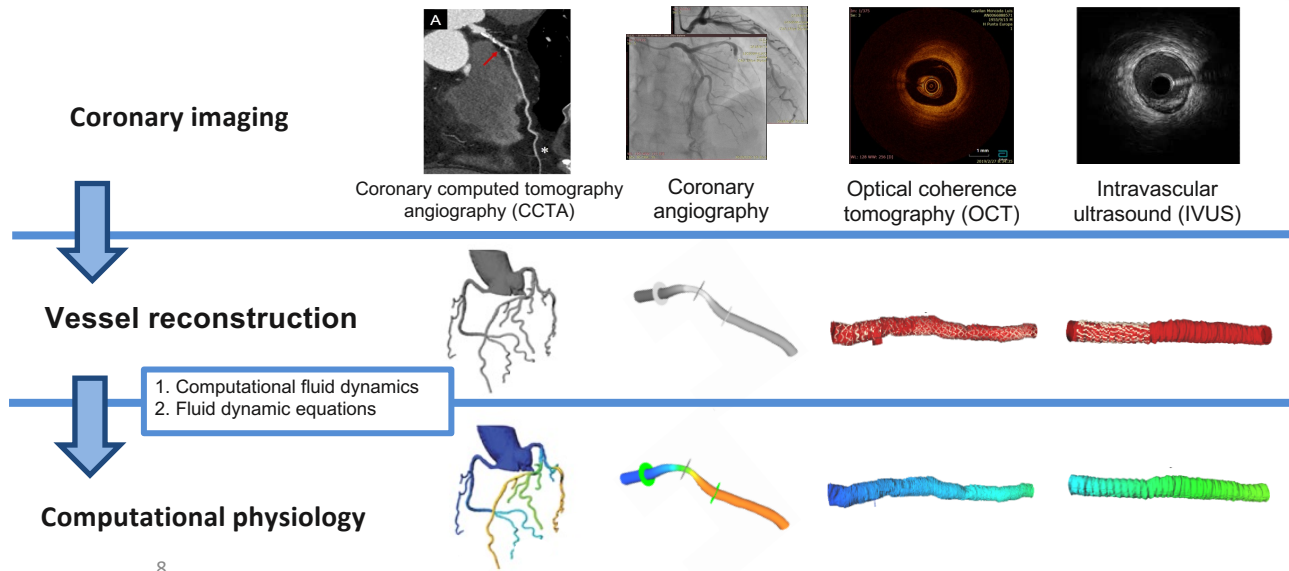

Limitations* :	
• Dérive	Prend du temps
• Adénosine	Temps de préparation et effets secondaires
• Manipulation invasive des guides	Risque et temps supplémentaires
• Évaluation des lésions tandem	Insérer des fils plusieurs fois (invasif, risque)
• Refranchissement t des stents pour obtenir le FFR à la fin de la procédure	Insérer/pousser un guide à travers un stent (invasif, risque)
• Cher	Coûts récurrents par procédure

Utilisation mondiale :
7 – 10%

Conclusion

- ✓ Chez le patient stable la documentation de l'ischémie et son attribution à un vaisseau donné sont indispensables à la bonne prise de décision
- ✓ Dans le cadre d'une revascularisation par angioplastie il est indispensable de s'assurer de la correction de l'ischémie dans le territoire traité
- ✓ La mesure "virtuelle" de la FFR par "l'angiographie coronaire fonctionnelle" est une technique **validée** (QFR: FAVOR III China) ou en cours de validation (vFFR:FAST III) qui permet de combler de nombreuses limites de la FFR/iFR:
 - ✓ Evaluation rapide des 3 axes coronaires.
 - ✓ Evaluation pendant MAIS AUSSI APRES la coronarographie (IDM, Heart team, oubli, ...)
 - ✓ Permet d'obtenir une cartographie de la perte de charge (pull-back virtuel)
 - ✓ Permet d'adapter le "stenting" (longueur, localisation) pour obtenir

Big Thanks to all Trial Partners!

Study Objective

- To determine the safety and effectiveness of a vFFR guided strategy versus an invasive FFR guided strategy to guide coronary revascularization in patients with intermediate coronary artery stenosis.

Trial Design

Fractional flow reserve or 3D-quantitative-coronary-angiography based vessel-FFR guided revascularization. Rationale and study design of the prospective randomized fast III trial

Alessandra Scoccia, MD,¹ Robert A. Byrne, MB, BCh, PhD, FESC,^{2,3} Adrian P. Banning, MD,⁴ Ulf Landmesser, MD,⁵ Eric Van Belle, MD, PhD,^{6,7} Ignacio J. Amat-Santos, MD,⁸ Manel Sabaté, MD,⁹ Jan G.P. Tijssen, PhD,¹⁰ Ernest Spitzer, MD,¹¹ and Joost Daemen, MD, PhD, FESC¹² *Rotterdam; The Netherlands Lille; France, Lille; France, Valladolid; Spain, Rotterdam; The Netherlands, Rotterdam; The Netherlands*

Background Physiological assessment of intermediate coronary lesions to guide coronary revascularization is currently recommended by international guidelines. Vessel fractional flow reserve (vFFR) has emerged as a new approach to derive fractional flow reserve (FFR) from 3D-quantitative coronary angiography (3D-QCA) without the need for hyperemic agent

- Où poser le stent : évaluation des dimensions du stent (longueur et taille)

**Performing pressure wire
measurements in patients with
MVD is very rare**

**Further virtualization to
« estimate » the pressure
drop**

A simple case!

Traitement médical
FFR > 0.81
iFR > 0.89

Angioplastie
FFR ≤ 0.80
iFR ≤ 0.89

Amore complexe case!

Traitement médical
FFR > 0.81
iFR > 0.89

Angioplastie
FFR ≤ 0.80
iFR ≤ 0.89

QCM 1

- Dans le cadre d'une angioplastie d'un vaisseau avec lésions diffuses/complexes, je vérifie la FFR à la fin de la procédure pour m'assurer qu'elle est > 0.80 :
 - A) Toujours
 - B) Jamais, cela prend trop de temps
 - C) Jamais, la valeur de FFR post-angioplastie n'est pas fiable

Primary Endpoint

MACCE (Death, MI, stroke or repeat revascularization) at 1 Year

	No. at Risk												
PCI	757	728	721	713	707	702	697	696	693	687	678	674	670
CABG	743	709	701	698	695	693	691	686	683	682	679	679	679

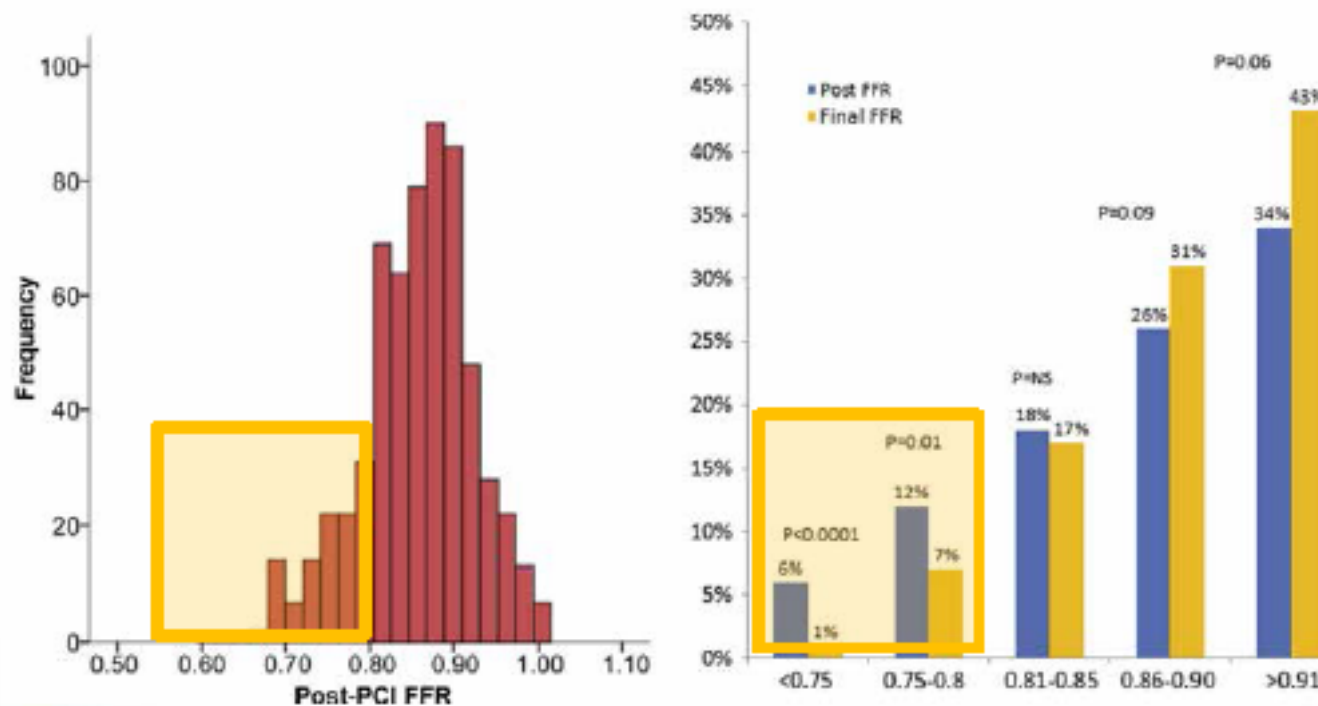

Procedural Characteristics

Variable	PCI (n=757)
% Lesions FFR measured	82%
FFR>0.80	24%
Staged procedure	22%
Number of stents	3.7±1.9
Total stent length	80 mm
Intravascular imaging	12%
FFR measured after PCI	60%

Variable	CABG (n=743)
FFR measured prior to CABG	10%
# of distal anastomoses	3.4±1.0
Multiple arterial grafts	25%
LIMA	97%
Off-Pump surgery	24%

Post PCI ischemia based on FFR ≤ 0.80 occurs in 10-20% of cases

Low post-PCI FFR is related to adverse events

Pijls N, et al. *Circulation*. 2002;105:2950-54.
Lee JM, et al. *J Am Coll Cardiol Interv*. 2018;11:2099-109.

Primary Study Endpoint

480 Patients with Angiographically Successful PCI and qualified iFR pullbacks

24% Residual Ischemia (112 patients with Post PCI $iFR \leq 0.89$)

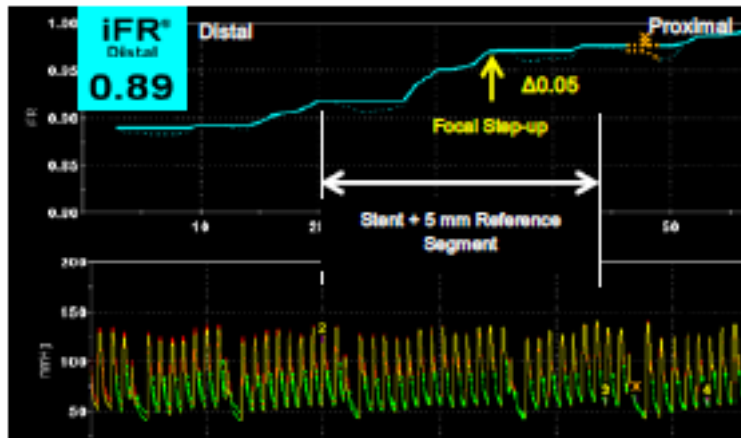

■ Post $iFR \leq 0.89$ ■ Post $iFR > 0.89$

Focal defined as step-up of ≥ 0.03 units in < 15 mm segment
Diffuse defined as > 15 mm segment

Focal Residual Pressure Gradient in-stent

Among the 93 vessels with focal disease, there were 146 segments (stent, proximal or distal) that had significant residual pressure gradients

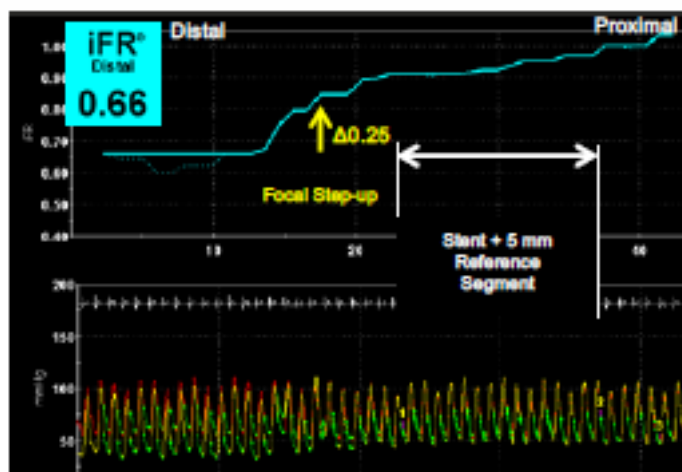

Focal Residual Pressure Gradient Prox to stent

'Physiologic miss' occurred in 31.5% of focal lesions proximally

Focal Residual Pressure Gradient Distal to stent

'Physiologic miss' occurred in 30.1% of focal lesions distally

Post-stenting fractional flow reserve vs coronary angiography for optimization of percutaneous coronary intervention (TARGET-FFR)

Damien Collison ^{1,2*}, Matthaios Didangelos ¹,

iFR et lésions en série

- Nombre et extension des sténoses n'impactent pas significativement le flux basal
- La perte de charge hémodynamique due à une lésion est spécifique à cette lésion uniquement
 - ✓ « Absence » de cross-talk entre les lésions en série
- Le changement du profil hémodynamique après angioplastie devient donc prévisible

Physiology-Guided PCI

Standard of Care PCI

Summary

- ✓ Recent studies have shown that 20-25% vessel territories remain ischemic after an apparently appropriately conducted PCI:
 - ✓ Once the procedure is “finished” it is possible but difficult to correct (TARGET FFR)
 - ✓ Pre-procedural pullback-derived pressure coronary mapping“
 - ✓ Combined to
 - ✓ virtual PCI” and c
would be key to improve the clinical outcome of our coronary patients, in particular those with MVD.
- ➔ It has also the potential to test different PCI scenarios and to predict the final “IFR/FFR” of these scenarios: Virtual PCI

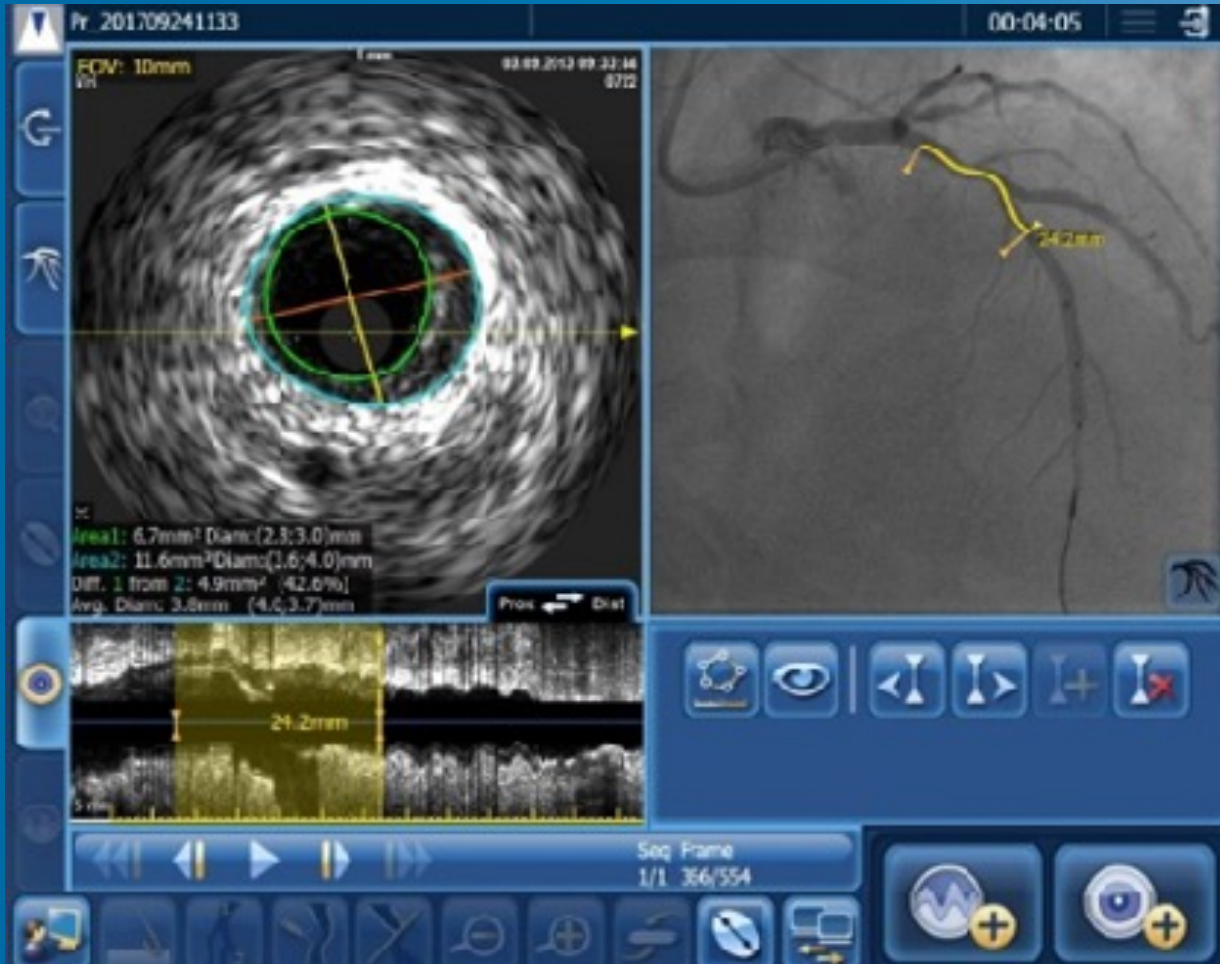

Procédure

Ultra low Contrast

- Total amount of contrast: 25 ml (CV/GFR 0.83)
- Uneventful in-hospital evolution.
- Patient discharged 2 days later. No modification of serum Cr levels.

Advanced IVUS imaging: IVUS co-registration

- Localization of IVUS withangiography to help avoid geographicmiss
- Easy length/area/diameter measurements with manual pullback to sizestent

Procédure Ultra low Contrast

Steps to reduce contrast in PCI

Study Design

Angiographic quantitative flow ratio-guided coronary intervention (FAVOR III China): a multicentre, randomised, sham-controlled trial

Bo Xu*, Shengxian Tu*, Lei Song*, Zening Jin, Bo Yu, Guosheng Fu, Yujie Zhou, Jian'an Wang, Yundai Chen, Jun Pu, Lianglong Chen, Xinkai Qu, Junqing Yang, Xuebo Liu, Lijun Guo, Chengxing Shen, Yaojun Zhang, Qi Zhang, Hongwei Pan, Xiaogang Fu, Jian Liu, Yanyan Zhao, Javier Escaned, Yang Wang, William F Fearon, Kefei Dou, Ajay J Kirtane, Yongjian Wu, Patrick W Serruys, Weixian Yang, William Wijns, Changdong Guan, Martin B Leon†, Shubin Qiao*‡, Gregg W Stoner‡; FAVOR III China study group‡

Summary 1

- ✓ Invasive pressure wire (FFR/iFR) is the “gold standard” for the detection of ischemic territory vessels.
- ✓ In patients with MVD, investigation of every vessel with lesion $> 30\%$ is critical to propose the best treatment option.
- ✓ Despite its benefit extensive one shot physiology investigation is difficult to achieve with invasive methods (in Flower MI only 5% of patients had complete FFR investigation at time of PCI).

Summary 2

- ✓ Recent studies have shown that 20-25% vessel territories remain ischemic after an apparently appropriately conducted PCI:
 - ✓ Once the procedure is “finished” it is difficult to correct (TARGET FFR)
 - ✓ Pre-procedural pullback-derived pressure coronary mapping“
 - ✓ Combined to
 - ✓ virtual PCI”
would be key to improve the clinical outcome of our coronary patients, in particular those with MVD.
- ➔ These approaches are difficult to achieve in most patients with current invasive techniques

Perspective

- ✓ Virtualization of coronary pressure drop using computational fluid dynamics derived from imaging (CT-scan or angiography) has a strong potential to provide a more complete picture of pressure drop in all coronary arteries in a single investigation.
- ✓ It has also the potential to test different PCI scenario and to predict the final “FFR” of these scenario: Virtual PCI

2019 ESC Guidelines on the diagnosis and management of chronic coronary syndromes

What is new in the 2019 Guidelines?

New recommendations (1)

Basic testing, diagnostics, and risk assessment

Non-invasive functional imaging or coronary CTA as the initial test for diagnosing CAD.	Invasive angiography to diagnose CAD in patients with <ul style="list-style-type: none">- a high clinical likelihood and severe symptoms refractory to medical therapy- typical angina at low level of exercise and clinical evaluation that indicates high event risk. Invasive functional assessment must be available and used to evaluate stenoses before revascularization, unless very high grade (>90% diameter stenosis).	Invasive coronary angiography with availability of invasive functional evaluation for confirmation of CAD diagnosis in patients with uncertain diagnosis on non-invasive testing.
Initial non-invasive diagnostic test based on the clinical likelihood of CAD, patient characteristics, local expertise and availability.		Coronary CTA as an alternative to invasive angiography if another non-invasive test is equivocal or non-diagnostic.
Functional imaging for myocardial ischaemia if coronary CTA has shown CAD of uncertain functional significance or is not diagnostic.		Coronary CTA when any conditions make good image quality unlikely.

■ Class I ■ Class IIa ■ Class IIb ■ Class III

Invasive angiography to diagnose CAD in patients with <ul style="list-style-type: none">- a high clinical likelihood and severe symptoms refractory to medical therapy- typical angina at low level of exercise and clinical evaluation that indicates high event risk.	Invasive coronary angiography with availability of invasive functional evaluation for confirmation of CAD diagnosis in patients with uncertain diagnosis on non-invasive testing.
Initial non-invasive diagnostic test based on the clinical likelihood of CAD, patient characteristics, local expertise and availability.		Coronary CTA as an alternative to invasive angiography if another non-invasive test is equivocal or non-diagnostic.
Functional imaging for myocardial ischaemia if coronary CTA has shown CAD of uncertain functional significance or is not diagnostic.	Invasive functional assessment must be available and used to evaluate stenoses before revascularization, unless very high grade (>90% diameter stenosis).	Coronary CTA when any conditions make good image quality unlikely.

■ Class I ■ Class IIa ■ Class IIb ■ Class III

©ESC

Patients with angina and/or dyspnoea and suspected coronary artery disease

Diagnostic approach (2)

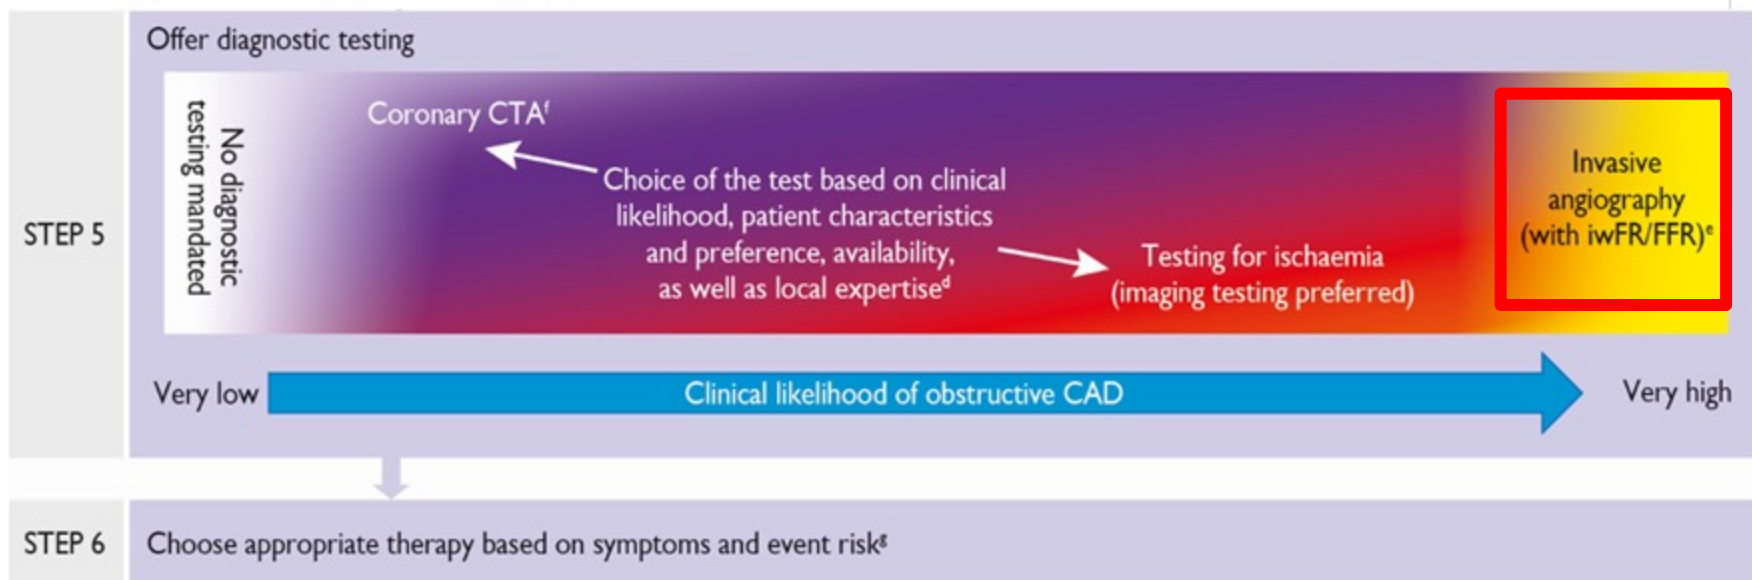

^d Ability to exercise, individual test-related risks, and likelihood of obtaining diagnostic test result. ^e High clinical likelihood and symptoms inadequately responding to medical treatment, high event risk based on clinical evaluation (such as ST-segment depression, combined with symptoms at a low workload or systolic dysfunction indicating CAD), or uncertain diagnosis on non-invasive testing. ^f Functional imaging for myocardial ischaemia if coronary CTA has shown CAD of uncertain grade or is non-diagnostic. ^g Consider also angina without obstructive disease in the epicardial coronary arteries (see section 6 of full text).
